See What Attackers See: Why Exposure Management Matters for Your Cyber Clients

Cyber risk doesn’t stand still, and neither do we.

Beazley’s Full Spectrum Cyber offering helps clients stay ahead of risk and this latest new capability helps them to pre-empt cyber-attacks.

What is Cyber Exposure Management?

A Cyber Exposure Management tool continuously monitors a company’s external attack surface to identify, track and reduce critical threats.

Internet-facing assets such as domains, applications and services should be monitored for vulnerabilities or weaknesses that provide an open door to attackers. If a threat is revealed, action can be taken to fix before an incident actually occurs.

Why this matters now?

A client’s digital footprint is constantly changing. New systems, cloud environments and third-party connections create new entry points, and at the same time, attackers are moving faster. AI is making cyber attacks easier with threat actors using it to search for these vulnerabilities at scale. And they’re highly successful with AI-enabled cyber attacks having an estimated 82% success rate[1]. This means it’s more important than ever for businesses to move quickly when identifying a system weakness and closing the gap before it can be exploited.

How does Beazley help clients stay one step ahead?

As part of Beazley’s Full Spectrum Cyber approach, our Cyber Exposure Management offering pre-emptively strengthens business resilience and gives clients clear, prioritised insight into their cyber risk.

Beazley Full Spectrum Cyber clients benefit from always-on monitoring of external-facing technologies, as well as continuous exposure tracking, prioritized emergency alerts, and clear guidance on what to fix first. Additional levels of Cyber Exposure Management capabilities are also available, including dark web monitoring for stolen credentials and

monitoring of third-party suppliers for potential risks.

We help our cyber clients to see what attackers see, act faster to reduce vulnerabilities and build resilience before an attack ever happens.
